

# Fire Protection

MADE IN GERMANY

FSK Detector

FSM Detector

FST Detector

FST-It Detector

Flying  
sparks

Embers

Hot  
surfaces

## The right detector for every application

Up to now, two types of detectors were required for the complete protection of production facilities (spark and ember detection), because for reasons of physical origin, classic spark detectors are only of limited suitability for the detection of embers, and therefore additional ember detectors would be required.

For economic reasons, however, usually only spark detectors were used in the past, so that the fire protection represented an economically acceptable compromise.

The new detector FSM combines the features of classic spark detectors with ember detectors protection and eliminate compromise solutions.

With the development of the combination detector FSM, T & B rounds off its wide range of different types of detectors and can now offer its customers the best possible detector for every requirement.
